Abstract: Ionic liquids (ILs) have been considered as advanced materials for different applications, due to the ability to be tuned and, as consequence new physical and chemical properties can be reached, such as low steam pressure, low flammability, chemical and thermal stability as well as good solubility of greenhouse gases. The combination of these specific properties makes of the ionic liquids good candidates for CO2 capture technologies.[1] In this present work molecular dynamics (MD) were carried out in order to correlate the effect of the gas absorption in the local liquid structure and its correlations with the dynamical properties of the system.[2] It were simulated three different ionic liquids, 1-ethyl-3-methylimidazolium bis(trifluoromethanesulfonyl)imide [C$_2$mim][Tf$_2$N], 1-ethyl-3-methylimidazolium acetate [C$_2$mim][Ac] and 1-Butyl-1-methylpyrrolidinium bis(trifluoromethanesulfonyl)imide [BMpyr][Tf$_2$N] with six different concentrations of CO$_2$ at 1 atm and 313 K. In Figure 1 can be seen the a combined distribution function (CDF) of the g(r) of H9-S and the angle of H9-O-S for the neat [C$_2$mim][Tf$_2$N] and the mixture [C$_2$mim][Tf$_2$N]/CO$_2$ with 50 gas molecule. It is possible to see a slightly change in the orientation of the cation and anion, which was correlated to the detachment of the ions in order to create an empty space to receive the carbon dioxide. However no change was observed in the g(r) on the top of the figure, evidencing that these changes occur just in the local structure of cation and anion.

Figure 2 shows that the addition of CO$_2$ in the ionic liquid has shown an increase for the diffusivity of ions, which was related to the decrease of cation-anion interaction strength caused by the presence of the gas between the ions. The transport properties results showed that the addition of CO$_2$ in the IL generates a fluidization[3] of the system, decreasing the viscosity as a consequence of the local environment structure changing. Likewise, the effect of the type of anion and cation on the systems properties was studied considering [Ac]$^-$ and [BMpyr]$^+$ ions, showing large effects by the change of anion to [Ac]$^-$ which rise from the strong [C$_2$mim]--[Ac]$^-$ interaction, which conditions the solvation of ions by CO$_2$ molecules.
Figure 1 - Combined Distribution Function (CDF) joining the angle and distance distribution for the H9-O(anion)-S(anion) and H9-S(anion), respectively, for the cation-anion interaction in (a) neat [C$_2$mim] [Tf$_2$N], and (b) fraction 0.24 [C$_2$mim][Tf$_2$N]/CO$_2$ at 313 K with a snapshot representing this interaction from MD simulations.

Figure 2 - Mean square displacement of [C$_2$mim]$^+$ and [Tf$_2$N]$^-$ in neat ionic liquid and mixture containing 50 molecules of CO$_2$ at 313 K.

Key-words: Molecular Dynamics, CO$_2$, Ionic Liquids

Support: The present work is supported by FAPEMIG, specifically by the project APQ-01120-10. We would also like to thank CAPES for the fellowship given to Tuanan C. Lourenço, Rede Mineira de Química, FAPERJ and LAME-UFF for the computing support and CNPq for the fellowship as well.
